Introduction to the s120_nrf51822 release notes

These release notes describe the changes in the s120_nrf51822 from version to version.

This is how the document is laid out:

- There is one main section per new version of the s120_nrf51822. This section will describe the changes from the previous version.
- Within each main section, there are sections for:
 - Bugfixes
 - Changes
 - New functionality
 - Limitations
 - Known issues

The release notes are intended to list all relevant changes in a given version. They are kept brief, to make it easy to get the overview. More details regarding changes and new features may be available in the s120_nrf51822 migration document.

s120_nrf51822_1.0.0-1.alpha

This release contains multilink improvements, new features and various changes and bugfixes, see details below.

Bugfixes

- Link layer
 - SVC handler now checks SPSEL and will use the Process Stack Pointer (PSP) if SPSEL=1. Previously the SVC handler only supported the use of the Main Stack Pointer (MSP) and using the PSP would result in undefined behavior (NRFFOETT-317, NRFFOETT-426, FORT-787).
 - Fixed hard fault handler issue that could corrupt the LR register or give invalid return address if hard fault triggered when SoftDevice was disabled (NRFFOETT-478, FORT-793).
 - ECB, CCM and AAR peripherals are now properly reset at SoftDevice enable (DRGN-3305, FORT-797).
 - Fixed an issue where the MIC status of the previous packet might be used instead of the one from the current packet, which could lead to accepting packets with MIC failure, or incorrectly disconnect due to MIC failure (DRGN-3177).
- GAP
 - Security: Fixed an issue where the SoftDevice would assert if sd_ble_gap_sec_params_reply() was called after disconnect (DRGN-3129).
 - Security: The Security Manager state machine has been audited and modified to protect it against malfunctions (DRGN-3756, DRGN-3371, DRGN-3320).
- GATTS
 - Fixed an issue where the SoftDevice would sometimes assert if the peer disconnected during the Write Long Characteristic Values and Reliable Writes procedures (DRGN-3759).
 - System attributes can now be written to with the Write Long Characteristic Values or Reliable Writes procedures (DRGN-3493).
 - Fixed an issue where the SoftDevice would assert if the peer canceled the Write Long Characteristic Values and Reliable Writes procedures (DRGN-3492).

Changes

- SoftDevice
 - API facing event structures and functions now consistently use evt in their names (DRGN-2232).
 - SVC number ranges adjusted (DRGN-3147, FORT-798).
- Link Layer
 - Link Layer Version Parameter, VersNr, has been updated. Updated documentation for sd_ble_version_get() (DRGN-3956).
- BLE
 - sd_ble_uuid_vs_add() now checks whether the UUID was previously added and therefore redundant (NRFFOETT-359, DRGN-2881).
 - Fixed inconsistent use of [in], [out] and [in/out] in API documentation. Also fixed inconsistent use of const keyword in API (DRGN-3440).
- GAP
 - sd_ble_gap_scan_start() and sd_ble_gap_connect() will no longer return NRF_ERROR_BUSY. No application retries are necessary anymore (DRGN-2297, DRGN-3831, DRGN-3309).
 - sd_ble_gap_device_name_get() now returns the full length of the name if the name is longer than the buffer provided (DRGN-3009, DRGN-3133).
 - The GAP device name permissions can now be set to writable regardless of name length (DRGN-3551).
 - The peer address field has been removed from the BLE_GAP_EVT_DISCONNECTED event (DRGN-2638).
 - Security: Passkey missing responses during pairing using BLE_GAP_AUTH_KEY_TYPE_NONE in sd_ble_gap_auth_key_reply() are now fully supported (DRGN-2540, NRFFOETT-290).
 - Documentation of min_conn_interval and max_conn_interval in ble_gap_conn_params_t clarified (NRFFOETT-451, DRGN-1040).
 - Reason codes for sd_ble_gap_disconnect() documented (NRFFOETT-526, DRGN-3235).
 - The default value for the Appearance Characteristic is set to 0x0000 (DRGN-3741).
 - Removed Peripheral Preferred Connection Parameters characteristic (DRGN-3636).
 - Security: BLE_GAP_EVT_CONN_SEC_UPDATE event now comes before BLE_GAP_EVT_AUTH_STATUS event for both pairing and bonding procedures (DRGN-3881).
- GATT
 - sd_ble_gatts_value_get() now returns the full length of the value if the value is longer than the buffer provided (DRGN-3009).
 - GATTC events now include the handle from the error response when applicable (DRGN-1966).

New functionality

- SoftDevice
 - Asynchronous flash memory write and erase support added to the SoftDevice interface. This interface can be safely used during active BLE connections (FORT-788).

- Temperature sensor support added to the SoftDevice interface (FORT-790).
- Faster SoftDevice enable when using RCOSC and 32k Clock source (DRGN-2390, FORT-792).
- SoftDevice is now unprotected unless `CLENR0` in `UICR` is set (FORT-791).
- Link Layer
 - Feature Exchange Link Layer Control Procedure fully supported (DRGN-3145).
- GAP
 - Security: MITM protection is now supported (DRGN-2839).
 - Concurrent master initiated connection parameter update and encryption procedures for multiple connections are now queued by the SoftDevice (DRGN-3762, DRGN-3830, DRGN-3603, DRGN-3573, DRGN-3355).
- GATT
 - Support for the Write Long Characteristic Values and Descriptors procedures (DRGN-3499, NRFFOETT-606).
 - Support for the Reliable Writes procedure (DRGN-3499, NRFFOETT-606).
- GATT
 - The GATT server is now capable of operating on multiple connections concurrently. Each connection now has its own system attributes (DRGN-3720, DRGN-3252, DRGN-3004, DRGN-2649).

Limitations

- SoftDevice
 - If Radio Notifications are enabled, flash write and flash erase operations initiated through the SoftDevice API will be notified to the application as Radio Events (FORT-809).
 - Synthesized low frequency clock source is not tested or intended for use with BLE stack.
 - DCDC converter operation controlled by the SoftDevice may interfere with radio function. As a result, `nrf_power_dcdc_mode` should not be modified by the application. The mode must not be set to `NRF_POWER_DCDC_MODE_AUTOMATIC` or `NRF_POWER_DCDC_MODE_ON` at any time (DRGN-2420).
- GAP
 - Security and connection parameter update procedures may time out locally or on the peer if multiple procedures have been started at the same time. This is due to the sequential execution nature of control procedures in the S120 SoftDevice and the fact that they can take a significant number of connection events to complete. With high connection intervals the amount of time required to perform those procedures approaches the timeout values set by the specification (DRGN-3597).
- GATT
 - To conform to the Bluetooth specification there shall not be a secondary service that is not referenced somehow by a primary service. The SoftDevice does not enforce this (DRGN-906, DRGN-2260).

Known Issues

- GAP
 - Using the `BLE_GAP_SCAN_INTERVAL_MIN` constant when scanning (`sd_ble_gap_scan_start()`) or connecting (`sd_ble_gap_connect()`) will prevent the SoftDevice from performing any scanning and therefore receiving any advertising reports. Use `BLE_GAP_SCAN_INTERVAL_MIN+1` or higher instead (DRGN-4050).
- LL
 - Under certain conditions, a call to `sd_ble_gap_scan_stop()` can remain blocked until the next scan interval (DRGN-3936).
 - Under certain conditions, and especially with heavy data traffic ongoing, an encryption procedure can fail leading to a disconnection (DRGN-3880).

s120_nrf51822_0.8.0-3.alpha

This S120 SoftDevice release adds multilink support, allowing the S120 to be connected to up to eight peripheral devices simultaneously. The SoftDevice implements a complete GAP Central, GAP Observer, GATT Client and a limited GATT Server API, and supports Just Works pairing. The S120 complements the S110 SoftDevice for development of end-to-end BLE applications.

The S120 API is subject to change in future releases but is suitable for application prototyping. Peripheral and Broadcaster specific APIs are published in this release, but are not supported and may remain so beyond the first production release of the S120.

In this release, example applications are added. For later releases, these will be moved to the nRF51 SDK and no longer distributed with the SoftDevice.

Bugfixes

- LL
 - Corrected a SoftDevice malfunction when connecting shortly after scanning (DRGN-3490).
 - Cancelling a connection no longer causes the Link Layer to malfunction (DRGN-2998, DRGN-2859).
 - Stray advertising reports now eliminated (DRGN-2892).
- GAP
 - Address whitelisting is now fully functional (DRGN-2891, DRGN-2712).
 - The peer address field is now correctly set on the disconnected event (DRGN-2637).
 - Security: DIV collisions are no longer possible (DRGN-2688).
 - Security: SMP Feature Exchange no longer causes the stack to malfunction (DRGN-3114).
 - Security: Incoming PDUs with an idle application no longer cause the SoftDevice to malfunction (DRGN-3005).
 - Security: Unexpected peer disconnection can no longer cause the SoftDevice to malfunction (DRGN-2878).
- GATTG
 - Triggering transactions repeatedly no longer causes the GATT client to fail (DRGN-3467).
 - Fixed an issue where an initialization failure could trigger stack malfunction (DRGN-3081).

Changes

- SoftDevice
 - SoftDevice memory requirements have been changed from the previous release (DRGN-3042, DRGN-3563):
 - 96kB of flash memory
 - 10kB of RAM
 - 1.5kB call stack memory
- Link Layer
 - CPU Suspend limited to connection only, suspend removed from the scanner (DRGN-3550, DRGN-3460). The CPU will not be available to the application during connection events but shall be during scanning events.
- GAP
 - A timeout can now be set when initiating a connection (DRGN-3051).
 - Memory has been optimized and streamlined to allow for 8 concurrent connections (DRGN-3156).
 - SuperVisor Calls applicable to the peripheral role only now return NRF_ERROR_NOT_SUPPORTED (DRGN-2889).
 - Security: Key Generation and Distribution has been redesigned to be more flexible and use less memory (DRGN-3143, DRGN-2767).
 - Security: Invalid SMP PDUs no longer generate a Pairing Failed response (DRGN-3352).

New functionality

- Link Layer
 - The Link Layer now supports up to 8 simultaneous connections (DRGN-1003, DRGN-2656, DRGN-2658, DRGN-2655, DRGN-2900, DRGN-2661).
- BLE
 - A new connection manager allows the SoftDevice to handle up to 8 simultaneous connections (DRGN-2903).
- GAP
 - GAP now supports up to 8 simultaneous connections (DRGN-2651, DRGN-2650).
 - RSSI is now reported during scanning (DRGN-3473).
 - Support for the Connection Parameter Update procedure as a central device (DRGN-3072).
- GATTG
 - A GATT client supporting up to 8 simultaneous connections is now functional and available to the application (DRGN-2648).
- GATTS
 - A read-only GATT server supporting up to 8 simultaneous connections is now functional and available to the application (DRGN-3416).

- L2CAP
 - A complete L2CAP data scheduler for concurrent links has been introduced (DRGN-2652, DRGN-3400).
 - Support for the L2CAP server role has been added to the SoftDevice (DRGN-2654, DRGN-3074).

Limitations

- GAP
 - Attempting to scan just after scanning or just after a connection cancellation may return an `NRF_ERROR_BUSY` error code. The application will need to retry until `sd_ble_gap_scan_start()` returns `NRF_SUCCESS` (DRGN-2997).
 - Attempting to connect just after or during scanning or just after a connection cancellation may return an `NRF_ERROR_BUSY` error code. The application will need to retry until `sd_ble_gap_connect()` returns `NRF_SUCCESS`.
 - Control Procedures (encryption and connection parameter update) initiated by the application using the corresponding API calls must be serialized by the application itself, since a single one is currently allowed to execute shared across all links. Failure to do so may result in an `NRF_ERROR_BUSY` error code. This applies to the following 2 functions:
 - `sd_ble_gap_encrypt()`
 - `sd_ble_gap_conn_param_update()` (update procedures initiated by the central only)
 - OOB pairing and Passkey Entry (MITM) are implemented but not verified for this release. Note: This implies that security mode 1, security level 2 is the only fully verified link security level. Security mode 1, level 3 is therefore available but not verified. Security mode 2 is not supported.
- GATTS
 - The GATT Server is currently read-only. While the APIs do not prevent the application to add writable attributes (`write_perm != BLE_GAP_CONN_SEC_MODE_SET_NO_ACCESS`) the stack will not function properly if such attributes are present on the ATT table (DRGN-2649).
 - Authorization is not currently supported. Attributes can not use the `rd_auth` and `wr_auth` bits in this release (DRGN-2649).
- L2CAP
 - The following L2CAP API functions are non-functional in this release:
 - `sd_ble_l2cap_cid_register`
 - `sd_ble_l2cap_cid_unregister`
 - `sd_ble_l2cap_tx`

Known Issues

- GAP
 - Security: The stack may malfunction if a security procedure on any link and a connection parameter update on any link (even the same one) happen to be triggered concurrently (DRGN-3330, DRGN-3355).

s120_nrf51822_0.6.0

This release enables SIG approved and proprietary profiles to be implemented in full. The s120 implements a complete GAP Central, GAP Observer, GATT Client and GATT Server API, and supports Just Works pairing. The s120 complements the s110 SoftDevice for development of end-to-end BLE applications.

The s120 API is subject to change in future releases but is suitable for application prototyping. Peripheral and Broadcaster APIs are published in this release, but are not supported and may remain so beyond first production release of the s120.

Bugfixes

Changes

- SoftDevice
 - Lower stack interrupts are extended by a “CPU Suspend” state during radio activity to improve link integrity. This means lower stack interrupts will block application and upper stack processing during a Radio Event for a time proportional to the number of packets transferred in the event (DRGN-2320, DRGN-2720)
 - A new error code (`BLE_ERROR_INVALID_ROLE`) has been added and used when relevant (DRGN-2623)

- Better documentation layout and searching (DRGN-2539)
- Message Sequence Charts added covering all of the Central functionality
- GATT Client
 - Full GATT Client functionality is now verified (DRGN-2639)

New functionality

- GAP
 - White list implemented for scanner (DRGN-2662)
 - Security: Pairing and Bonding with no MITM (Just Works) implemented (DRGN-2405)
 - Security: Encryption reestablishment with stored keys implemented (DRGN-2562)
- GATT Server:
 - Full GATT Server implemented (DRGN-2807)

Known Issues

- GAP
 - Peripheral and Broadcaster API functions are currently published, but will cause undefined behavior if called (DRGN-2889)
 - Pairing and bonding with MITM enabled may cause SoftDevice assertions (DRGN-2839)
 - Using the white list to create connections does not function correctly (DRGN-2891, DRGN-2859)
 - Triggering a pairing procedure immediately after a previous one has completed during the same connection may cause SoftDevice assertions (DRGN-2878)

s120_nrf51822_0.5.0

Bugfixes

(This is the first release, so no known bugs fixed)

Changes

(This is the first release, so no changes)

New functionality

- Link Layer
 - Scanner
 - Initiator
 - Master (single link)
- SoftDevice
 - sd_softdevice_enable()
- BLE
 - sd_ble_evt_get()
 - sd_ble_tx_buffer_count_get()
- GAP
 - Scan
 - sd_ble_gap_scan_start() (passive scanner)
 - sd_ble_gap_scan_stop()
 - Connect
 - sd_ble_gap_connect()
 - sd_ble_gap_disconnect()
 - sd_ble_gap_connect_cancel()

- GATTC
 - `sd_ble_gattc_primary_services_discover()`
 - `sd_ble_gattc_characteristics_discover()`
 - `sd_ble_gattc_write()`
- L2CAP

The s120 is based upon Nordic Semiconductor's existing Bluetooth Low Energy codebase. In addition to the functionality above, other functionality is exposed in the API. That other functionality may or may not be present or working in the softdevice, but is in any way not considered a part of the release. It is recommended to use only the APIs for the functionality listed above.

Known Issues

- Limited testing
